We are BOI

AI Transformation Studio

Everyone sells AI efficiencies. We build for growth.

INVENT

Designing and building AI-first products, services and business models.

TRANSFORM

AI-first transformation of service delivery, innovation, marketing and sales.

The comfortable illusion: Most companies are treating AI as a productivity upgrade.

- AI strategy = list of use cases
- Rolling out copilots
- Running pilots
- Creating AI taskforces
- Training employees
- Roll out governance policies

All important.
But **largely insufficient.**

Control

AI reallocates control, compresses margins and shifts power to whoever owns the algorithmic layer.

Shaped

AI shapes how decisions are made.

Executed

AI executes decisions on behalf of users.

Removed

AI makes intermediary roles or production layer unnecessary.

Control

Control shifts | AI becomes decision interface for customer

Agentic commerce
AI Chatbot

Yesterday

Agentic commerce
AI Shopping assistant

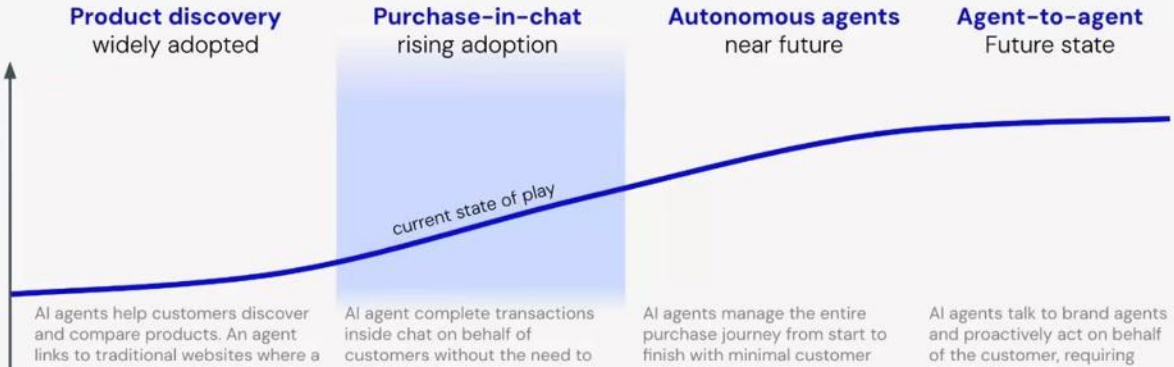
Today

Agentic commerce
AI Storefront

Tomorrow

Control

Today, agents can complete transactions inside the AI chat, the next phase will be about agents managing the entire purchase journey from start to finish



Implications for sellers and retailers are profound

Control

- Optimizing for multiple agents: Sellers will have to optimize for AI agents whose preferences differ across model providers.
- Margin erosion: As AI agents sit between buyers and sellers, they'll take a share of the value, boosting volume but eroding margins.
- Data monetization at risk: The growth of zero-click search erodes direct traffic, along with ability to understand/ influence consumer behavior.
- Revenue streams threatened: Traditional advertising-based monetization model becomes weaker, while value shifts to "AI-visibility optimization".

Control

When algorithmic commoditization hits hardest

AI commoditizes markets that are comparable, measurable & frequently optimized

Market is comparable
Substitution is feasible

- The core product is standardized.
- Multiple suppliers can meet same need.
- Switching does not threaten continuity.

Buying logic is price-driven
Optimization matters more than uniqueness

- Price is a dominant decision factor.
- Differentiation is limited.
- Buyers optimize primarily on cost.

Decision environment favors AI
Humans struggle. Algorithms excel

- Decisions are high-frequency.
- Options are information-heavy and complex.
- Performance is measurable and quantifiable.

Examples

- Energy procurement
- Telecom plans and bundles
- Cloud usage / pricing models
- Freight booking
- Commodity trading
- Energy trading and retail
- Insurance

AI doesn’t just reallocate control inside markets.
It also reshapes who can enter the market in the first place.

Competition

The second-order disruption: new competitors

AI reduces the cost of building products, expertise, coordination and scaling. You no longer need scale, HC or deep expertise to compete.

01

Expertise becomes reproducible
5-person startups compete with 100-person teams.

02

Production becomes software-defined
New players operate with minimal headcount and build fast.

03

Coordination cost collapses
Lean companies move faster than incumbents.

"AI doesn't just bring new competitors.
It changes what is perceived as valuable.

Value

AI changes what customers want to pay for

From selling units or hours to selling integrated, intelligent value delivery.

Human-time monetization erodes

Billing for effort becomes harder to defend as growth decouples from headcount.

Direct replacement:

- Basic design
- Translation
- Entry-level legal drafting

Human-time erosion:

- Consulting
- Legal
- Accounting

How to tell if your business model is at risk from AI

01
Operational exposure

02
Business model vulnerability

03
Distribution & interface disintermediation

04
AI capability maturity

05
AI-native entry barriers

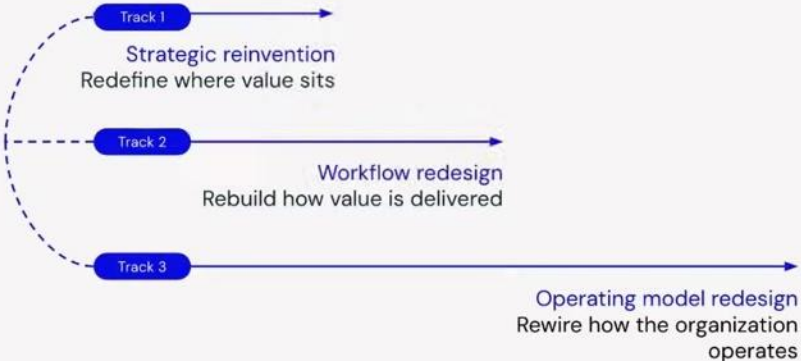
06
Differentiation erosion

07
Customer acceptance & sensitivity

08
Regulatory friction & compliance barriers

Three tracks of AI-first transformation

As AI restructures markets, AI transformation needs to operate on three tracks



AI is not a technology shift. It is a market shift.
And market shifts don’t reward optimization,
they reward reinvention.
